```python
class Solution(object):
    def isPowerOfThree(self, n):
        power = 1
        if n < 0:
            return False
        while power < n:
            power = power * 3
        return power == n
```
